The surface tension of Polish crude oils. Jan Jacek Ologosowski and Krystyna Czapliska. *Nafta* (Poland) 7, 160-3(1931).--The surface tension and oil-water interface tension of samples of 18 Polish crude oils were detd. with a stalagmometer and a tensiometer, for possible use in the secondary recovery of oil. The values are generally higher for oils of higher sp. gr., with deviations noted for oils having an increased acid no. Data are also given on the interface tension between oil and 1-30% solns. of NaCl, Na₂SO₄,

*CaCl₂, and MgCl₂. For Na₂SO₄, the values are almost directly proportional to concn., while for the other solns. the curves show maxima and (or) minima which cannot be explained at present.

TITLE: Induction heating of extrusion press chambers by main frequency current

PERIODICAL: Wiadomości hutnicze, no. 11, 1962, 334-339

TEXT: To close a gap in technical literature, empirical designing specifications are given for 50-cycle induction heating of extrusion press chambers, illustrated with a jacket-contained coil designed and built by the authors for a 1,000 ton extrusion press. Power requirements were established according to the specific heat calculus with appropriate allowance for power and heat losses. The coil of the experimental heater was made of copper wire 18.0 mm in diameter, insulated with 3.5 mm thick mica foil, designed to stand a load of 1.5 kA and a current density of 5-10 A/mm² at temperatures up to 500°C. The coil was powered by a 45 kVA transformer, primary winding 380 V, secondary winding 90 V in steps of 15 V, current load

TITLE: The development of automatic control for strip-rolling reversing mills

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 12, 1962, 17, abstract 12D94 ("Rudy i metale niezeli", 1962, v. 7, no. 6, 265 - 268, Polish; summaries in Russian, English, French and German)

TEXT: The problem of regulating the tension of a ≤ 1 mm thick strip has been considerably simplified by the indirect measurement of the tension (measuring the current power of the armature of the drum drive etc.). In the described scheme of the device for indirect tension and strip control there are two main units: 1) the armature current control; 2) control of the motor voltage in accordance with the rolling speed. The device includes an asynchronous motor, the rolling mill motor, the reeler motor, the inertia motor; the main, auxiliary and tachogenerator motors; the main and auxiliary exciting dynamos; the main exciting dynamo coil control; compensation, comparison, master and

The development of automatic control for...

exciting coils, and a series of resistances. A device is described for the direct measurement of the strip tension. In this case the strip bends around three tension rolls, which are arranged at a definite angle. The tension force is measured with induction tensometrical or compensation methods. The main deficiency of the method using tension rolls, is the difference in the mechanical properties of the strip and its partial plastic deformation, since the strip is not absolutely elastic. The magnitude of error in the method is about 3%. In contactless automatic control of the strip thickness, a bundle of beams from radioactive isotopes passes through the strip and partially loses its intensity. The beams passed through the strip, fall upon a detector and produce an electric signal which is amplified in the amplifier and is then supplied to the control device. Depending on the magnitude of deflection of the strip thickness, the control device supplies the corresponding pulse to the clamping-screw drive of the mill. To eliminate the frequent interferences in the mill operation by the control device, the latter does not react to short-time deflections of the strip from a thickness of a definite magnitude. A description is given of the device controlling the tension and thickness of the strip, where the strip thickness is measured by the described method with the use of isotopes. It is mentioned that

Card 2/3

The development of automatic control for...

deflections from the strip width can be rapidly eliminated by varying the tension. The device operates with about 4% accuracy at about 26% deflection of the thickness before the rolls. The strip width is 90 mm. At a greater strip width, i. e. at an increased power of the mill drive, the device will operate less accurately, but it is assumed that it will be possible to roll strips with up to about 5% tolerances after perfecting the device. A short description is presented of a program-control reversing strip-rolling mill, based on the punched card system. Light is passed through the perforations in the cards and falls upon a photodiode, where electric current is generated which, after amplification, is supplied to the corresponding devices.

Title : 24-hours Variations in the Hepatic Glycogen Contents in the White Mouse.

Orig Pub : Folia Morphol., 1956, 7, No 3, 199-205

Abstract : The daily content of glycogen in the liver of white male mice (80) was determined in the summer and in the fall, the diet and the laboratory conditions being normal. every 3 hours, 5 animals were killed and the amount of glycogen was determined in the liver preparations stained by the (Best method). In the summer, the smallest amount of glycogen was observed at 9 AM, and the biggest amount - at 6 PM. The second rise was taking place at 3 AM. In the fall, the highest amount was observed at 6 AM and 6 PM, the lowest - at 9 AM and 9PM.

The quality of margarine. I. The influence of refining and hydrogenation upon the quality of raw fats. Jerzy Czaplicki, Kazimierz Danowski, Augustyna Jakubowska, Wladaw Krolkowski, Henryk Nowinski, and Irena Uniska (Zaklad Tluszczyw, Odansk, Poland). *Prace Glownego Inst. Przemyslu Rolnego i Spozycowego* 4, No. 1, 1-12 (1954).—The changes of the analytical values of vegetable oils are studied as these are brought about by various methods of refining and hydrogenating, with special attention to rapeseed oil (I), as this is the main ingredient in the best-known brand of Polish margarine ("Ceres"). During refining some of the P-O-N linkages in the P.O.C.H.

CH₃NaFeO part of the lecithin (II) hydrolyze; this is of importance for the antioxidant action of II. Thus the P values for II are of no abs. value. The hydrations of peanut oil (III) and of I are studied over a temp. range from 50 to 85°, as a function of the intensity of agitation and the amt. of H₂O present. The hydration values for III scatter without disclosing a definite trend, but the values for I increase from 17.0 to 28.0% if the temp. rises from 60 to 85°. Refining is done with various strengths (%B₂) of NaOH, at various temps., durations, in one-step and multiple-step procedures. No generally valid recipe can be given;

it is of importance to wash out the excess NaOH down to 0.005%. Deterioration decreases the free acids in I to 0.1% and better, and in III to 0.075% and better. Hydrogenation is done at 150° with 0.3 atm. H pressure with a catalyst which contains 0.25% Ni; it was found that raising the Ni to 0.43% does not offer any advantages, and changing the temp. in the range from 140 to 210° too does not have much influence; at all these temps. III shows a change in the iodine value from 88.1 to 69.4 (highest) and 68.1 (lowest).

Niewiadomski, B. / Czapliski, J. Deodorization of Cod Liver Oil by the Lowest Degree of Hydrogenation.

„Odwołanie trąci przez najniższy stopień uwodornienia”. Prace Gl. Inst. Przem. Roln. i Społ. No. 2), Warszawa, 1952, PWT, 113 pp., 7 figs., 23 tabs.

lish Technical Abst.

. 1 1954

emistry and Chemical Technology

Investigations have enabled a method of deodorization of cod liver oil by the lowest degree of hydrogenation to be worked out. In this method, the following conditions of hydrogenation are necessary: a temperature of 210—220°C, a fresh „formic” 1% catalyst or a 1—2% used catalyst, „typhoon” type mixing and a pressure of 0.1 to 0.5 atm. By using oil from fresh cod liver properly refined, deodorized products can be obtained with iodine numbers of 105—110. During the investigations, the effect of the following parameters was determined: temperature, catalyst, intensity of mixing and pressure. It was confirmed that such factors as increase of temperature, increasing the quantity of catalyst, and intensity of mixing, together with increasing amount, have a favourable effect on the rate of processing. It was also confirmed that the selectivity of hydrogenation decreases as the temperature is reduced, the pressure increased and a fresh catalyst applied without the addition of a used one. Investigations into the reappearance of oil odour showed that the products obtained by this method were permanently deodorized.

1957, 7, No 1, 26-33

Abstract : An addition of up to 20% of liquid oil (O) to alimentary
fat (AF) does not produce any essential influence on the
consistency, preservation and alimentary value of AF-s.
The taste and the odor of a AF with the addition of 25%
of burdock oil or 30% of peanut oil did not change after
40 days of storage in summer time. At the addition of

"The Value of the Shape and Time of the Intrinsic Deflection of Ventricular
Extrasystoles in the Diagnostic Electrocardiography (ecg)."

Warsaw, Polaki Tygodnik Lekarski, Vol 17, No 52, 24 Dec 62, pp 2029-2032

Abstract: [Authors' English summary modified] The relation between
ecg picture of the ventricular extrasystoles (pointed, notched and dented
peak) and the kind of circulatory changes was analysed according to the
reports of D. Gross. The authors are of the opinion that the shape of the
ventricular extrasystoles, the time of intrinsic deflection and T. shape
are of no diagnostic value. The other ecg abnormalities i.e. ST-T changes,
which appeared in 85% of the cases of ventricular extrasystoles of organic
origin are of greater use.

This article contains five diagrams and ten references. Three of the
references are Polish.

Adsorption of helium, neon, and hydrogen by activated carbon at higher pressures and at the temperature of liquid nitrogen. Andrzej Czaplinski and Emil Zieliński (Acad. Górniczo-Hutnicza, Kraków, Poland). *Przemysł Chem.* 37, 640-1 (1958) (English summary).—Pressures up to 30 atm. were used in the above adsorption. H was better adsorbed at lower pressure. The adsorption of Ne and H at the lower pressures was nearly equal, while the adsorption of He at these conditions was negligible. Thus, the sepn. of He from Ne (in their concentrate) by the thermochromatographic method should be carried out at lower pressures (below 5 atm.).

 Determination of gold in alloys containing copper and silver by potentiometric titration with hydroquinone. Andrzej Czaplinski and Jan Trokiewicz (Katedra Anal. Tech. i Towaroznawstwa Politechniki Gdansk, Poland). Chem. Anal. (Warsaw) 4, 403-6 (1955) (English summary). — The reaction: $2\text{NaAuCl}_4 + 3\text{p-C}_6\text{H}_4(\text{OH})_2 \rightleftharpoons 2\text{Au} + 3\text{p-C}_6\text{H}_4\text{O}_2 + 2\text{NaCl} + 6\text{HCl}$ was used for detg. Au in alloys contg. Cu and Ag. Pt and calomel electrodes were used. Potential change at 50% at equiv. point after adding 1 drop 0.01N hydroquinone was above 100 mv. Dissolve sample contg. about 140 mg. Au in aqua regia with 130 ml. NaCl. Pickle low Au alloys in HNO_3 (d. 1.2 and d. 1.4) and dissolve in aqua regia contg. NaCl. Evap. the soln. almost to dryness, treat with 10 ml. concd. HCl, and re-evap. to 1 ml. Dil. with H_2O to 100 ml., filter AgCl, wash till neutral, and dil. the soln. with H_2O to 250 ml. Dil. 25 ml. of soln. with H_2O and titrate with 0.01N hydroquinone (dissolve 0.5505 g. $\text{p-C}_6\text{H}_4(\text{OH})_2$ in twice-distd. H_2O , add 2-3 ml. HCl, and add H_2O to make 1 l.). Cu, small amts. of Pt, and pH range 2-5 do not affect the detn. The method can be applied in serial industrial analyses. Z. Kurtyk

COUNTRY : Poland B-13
 CATEGORY :
 ABS. JOUR. : RZKhim., No. 1959, No. 85529
 AUTHOR : Czaplinski, A.; Zielinski, E.
 INST. :
 TITLE : Adsorption of Helium, Neon, and Hydrogen at
 Silicagel and Aluminagel at Temperature of
 Liquid Nitrogen and High Pressures.
 ORIG. PUB. : Przem. chem., 1959, 38, No 2, 87-88
 ABSTRACT : Different samples of silicagel (SG) and alumina
 gel (AG) were studied to find an adsorbent suitable for
 separation of mixtures of He and Ne. Adsorption of He, Ne,
 and H₂ was effected at temperature of liquid N₂ and 0-30
 atmospheres pressure. Adsorption of these gases increases
 in the order He < Ne < H₂. Finely porous SG yielded best
 results. Use of pressures of the order of several atmos-
 pheres promotes separation of H₂ from Ne, further increase
 of pressure is detrimental. It is noted that Langmuir's
 equation does not apply to adsorption of Ne.
 Ya. Satunovskiy.
